Summary

Software Engineering student graduating in June 2027, with two internships at Efsora Labs building AI-backed full-stack products: a healthcare chatbot in React, TypeScript and FastAPI, and an internal Slack agent. I focus on frontend work in React and Next.js that sits on top of real backends, with an emphasis on component architecture, design systems and performance.

Experience

Efsora Labs, AI Applied Full Stack Developer Intern

Jul 2026 – Sep 2026

- Built chatbot infrastructure for a healthcare provider end to end with FastAPI, React and TypeScript; the patient-facing widget runs in Turkish, English, Russian and Arabic (right-to-left).
- Built an internal Slack agent (FastAPI, Slack SDK, Gemini API) that answers questions about channel conversations; parallelized channel scanning with a thread pool and cached users at startup to remove redundant API calls.
- Worked with AWS EC2, S3 and IAM; ran open-source LLMs on local hardware and analyzed memory use, resource consumption and latency.
- Ran mobile test cycles for a portable ultrasound device; worked in daily stand-ups and sprint planning.

Efsora Labs, Software Engineering Intern

Jan 2026 – Feb 2026

- Built and deployed a real-time multiplayer Tic-Tac-Toe with Node.js and Socket.io, containerized with Docker and hosted on Render.
- Modelled data in PostgreSQL and compared functional and object-oriented approaches on the same problem.
- Prepared and presented a 20-page talk on SOLID principles and design patterns to the team.

WIN – UC Berkeley AMENA Certificate Program

Winter 2024–2025 (4 months)

World Innovations Network

- Global entrepreneurship and applied-AI program with Silicon Valley mentors.
- Developed a product idea in a team with mentor feedback; the project has since become a company.

Projects

Portfolio website

Next.js, Tailwind CSS, Three.js

- Built on the Next.js App Router with a reusable component architecture: content-agnostic UI primitives composed into sections, Server Components by default and Client Components only where the browser is needed.
- Two-layer design token system (primitive and semantic) in Tailwind CSS v4 drives the UI, light and dark themes and the WebGL canvas; motion tokens set the timing of every Framer Motion animation (staggered reveals, shared layout transitions).
- Custom Three.js particle system that morphs between shapes on scroll; interpolation runs in a hand-written GLSL vertex shader and Three.js is lazy-loaded with next/dynamic.

Slack Agent [GitHub](#)

React, FastAPI, Gemini API

- Answers questions about a Slack channel, including thread replies; the model returns fixed-schema JSON so the React UI renders cards without guessing which fields exist.

Real-time Tic-Tac-Toe [Live](#) [GitHub](#)

Node.js, Socket.io, Docker

- Two-player game synced over WebSockets; game state managed with functional patterns, including an Option monad.

Education

İzmir University of Economics, B.Sc. Software Engineering

Expected June 2027

Skills

Frontend: React, Next.js, TypeScript, JavaScript, Tailwind CSS, Framer Motion, HTML, CSS, Three.js, WebGL/GLSL

UI architecture: Reusable component architecture, design tokens, responsive and accessible interfaces

Design: Figma (Auto Layout, component variants)

Backend: Python, FastAPI, Node.js, Express, Socket.io, Java, PostgreSQL

Infrastructure: Docker, AWS (EC2, S3, IAM), Vercel, Render, Git

AI: Gemini API, structured-output prompt design, local LLMs

Languages: Turkish (native), English (B2), Spanish (A2)
